Excitement abounds over one of the newer trends technology has to offer. Smaller than the conventional laptop, the scaled down laptop is quickly becoming extremely popular. This smaller, more compact version is known as a subnotebook, a netbook, a mini note, or a mini laptop. Call it what ever you will but the fact remains the same, it is quickly becoming very popular.

Netbooks, which have much lower starting prices, focus on no frill basic computing functions. Netbooks have found quite the market with children, people on the go and first-time computer users. As we endure such a difficult economy, the mini laptop has attracted the attention of many.

This increasing boom in interest really is of no surprise because of their very inexpensive price combined with quality. You typically will find a mini notebook starting at just under \$300.00. They tend to be tiny, light, very mobile, and non complicated. They are ideal for the entire family.

Children who are students find the super portable aspect very convenient. Adults on the run find these to be just as friendly without the huge cost and bulkiness of the conventional laptop. These features plus the affordability of the scaled down laptop contribute to the growing popularity.

Affordability is not the only reason these mini laptops are in demand. For those who want something that performs and is compact yet quite portable, the mini laptop is perfect.

Mini laptops are usually equipped with a seven to ten inch screen, Intel Atom processing, weigh around two to five pounds, a hard drive, and have two to five hours of battery life.

Believe me, these are just a few features of the mini laptop. It is no wonder they are one of the most popular gadgets in technology today.

Even though you get a small laptop with a basic set of features, limited performance, and often a small hard drive, many mini laptops run Windows XP, are very inexpensive, and well equipped to provide all that is necessary for a complete internet experience.

Also appealing is that they are quite portable and usually very sturdy. This feature makes them ideal for people who need something in addition to their regular computer or full sized laptop.

The idea of just dumping it in a bag and taking off to the shore or the trail without the bulkiness is very enticing. If it is lost or destroyed, it is not nearly as devastating. This makes the mini laptop wonderful for children or students who have not yet learned the value of the dollar!

As an educator and a parent, I can appreciate the value of these small, sturdy, productive, yet affordable devices. Quick access to the internet and computing is a necessity in society today for people of all ages.

Unfortunately, having the financial means to purchase and provide for a family of internet ready individuals can be a challenge.

We as parents and educators would like everyone to have access to technology but given the economy, that is not always easy. I see however, that the availability of the mini laptop in the market place today lessens that financial burden.

Call it a scaled down laptop, a subnotebook, a netbook, a mini note, or a mini laptop, it all amounts to being a great product at a great price. This very affordable, state of the art device allows technology to be more readily available to most even in the midst of this poor economy.
